Abstract

The existence of generalised global supersolutions with a control upon the total mass is established for the parabolic-parabolic Keller-Segel system with logarithmic sensitivity for any space dimension. It is verified that smooth supersolutions of this sort are actually classical solutions. Unlike the previously existing constructions, neither is the chemotactic sensitivity coefficient required to be small, nor is it necessary for the initial data to be radially symmetric.

Keywords: chemotaxis; generalised supersolution; global existence; logarithmic sensitivity.
MSC 2010: 35B45, 92C17, 35D30, 35D99, 35K55.

1 Introduction

Coupled reaction-diffusion-transport PDEs are a standard tool in the mathematical modelling of cell motility on the macroscale. Thereby, the diffusion-dominated systems are among the best studied analytically. Standard theory (see, e.g., [13]) ensures the existence of bounded solutions to such systems. Still, they are not always the optimal choice. Indeed, in many instances it is not the chaotic movement but, rather, the active drift of the cells towards some substance which actually dominates the motion and, as a result, may lead to a strong aggregation of the biomass density. The best known model example of such a situation is provided by the celebrated Keller-Segel system for chemotaxis [11, 12]. This parabolic-parabolic system and its parabolic-elliptic simplifications have been objects of extensive studies in recent decades. It turned out that in higher spatial dimensions the solutions to such systems can exhibit a blow-up in finite time which calls into question the global solvability. For certain parabolic-elliptic versions of the classical Keller-Segel model on the plane one was able to extend the solutions which collapse into a persistent Dirac-type singularity beyond a finite-time blow-up by constructing measure-valued continuations [16, 21]. For a detailed overview of available results concerning boundedness/blow-up, as well as other properties, of the Keller-Segel model the reader is referred to [2, 10].

Very recently a new solution concept was introduced [15] in the context of a version of the Keller-Segel system with a signal-dependent chemotactic sensitivity:

$$\begin{cases} \partial_t u = \nabla \cdot \left(\nabla u - \chi \frac{u}{v} \nabla v \right) & \text{in } \mathbb{R}^+ \times \Omega, & (1.1a) \\ \partial_t v = \Delta v - v + u & \text{in } \mathbb{R}^+ \times \Omega, & (1.1b) \\ \partial_\nu u = \partial_\nu v = 0 & \text{in } \mathbb{R}^+ \times \partial\Omega, & (1.1c) \\ u(0, \cdot) = u_0, v(0, \cdot) = v_0 & \text{in } \Omega, & (1.1d) \end{cases}$$

where Ω is a smooth bounded domain in \mathbb{R}^n , $n \in \mathbb{N}$, with the corresponding outer normal unit vector ν on $\partial\Omega$, and χ is a positive number. In this model prototype the cells are assumed to respond to the changes of the logarithm of the signal concentration thus following the Weber-Fechner law. Due to the saturation effect upon the chemotactic sensitivity in the presence of high levels of signal concentration, the solutions of both (1.1) and the corresponding parabolic-elliptic versions are less prone to the formation of strong singularities, such as, e.g., Dirac measures, than those of the classical Keller-Segel model. In particular, the global existence of bounded classical [2, 6–9, 14, 17, 18, 22, 25], weak [20, 22], and generalised [3, 15] solutions was established for certain ranges of parameter χ which depend upon n and, also, on whether the setting is radial-symmetric or not. On the other hand, it is known, for a parabolic-elliptic case at

least [18] that blow-up solutions exist for $n \geq 3$ and χ large enough. To the best of our knowledge, no solution concept has as yet been proposed for (1.1) which would allow to treat the general non-radial symmetric setting and arbitrary large $\chi > 0$ if $n \geq 3$. The present work aims to fill this gap.

In [15], the authors introduced the coupled quantity

$$F(u, v) = u^p v^q \tag{1.2}$$

for

$$p, q \in (0, 1)$$

and derived a variational inequality which it should satisfy provided that u and v solve (1.1) in the classical sense. They showed that such inequality, when complemented by a control upon the total mass and equation (1.1b) fulfilled in the usual weak sense, together comprise a reasonable concept of a global solution to the full parabolic-parabolic system (1.1). This construction made it possible to extend the range of χ 's for which (1.1) can be considered as globally solvable, namely:

$$0 < \chi < \begin{cases} \infty & \text{if } n = 2, \\ \sqrt{8} & \text{if } n = 3, \\ \frac{n}{n-2} & \text{if } n \geq 4 \end{cases} \quad [15]. \tag{1.3}$$

Indeed, previously available results on global solvability presupposed either a more restrictive condition on χ [22], or the radial symmetry requirement [20]. The generalised solution from [15] is a limit of a regularising sequence. Thanks to condition (1.3), the u -component of this sequence is uniformly integrable over arbitrary finite time-space cylinders. An important consequence of the later is the fact that the generalised solution satisfies equation (1.1b) in the usual weak sense. In this paper we further develop the framework presented in [15]. The key idea is to replace (1.2) with

$$F(u, v) = u^{-a} v^{-b} \tag{1.4}$$

where parameters a and b are assumed to satisfy

$$a > 0 \quad \text{and} \quad b > b_+(a) := \frac{1+a}{2} \left(\sqrt{1+\chi^2 a} - 1 \right), \tag{1.5}$$

so that clearly

$$b > 0$$

as well. An advantage of switching to a negative power of u in (1.4) is that the imposed restriction on b in (1.5) can be met for any $\chi > 0$. On the negative side is that the u -components of the approximation sequence need no longer be locally in time uniformly integrable. As a result, the limit pair (u, v) , while remaining a supersolution to (1.1b), may, however, fail to be its subsolution, even in the weak sense. Thus, our approach to (1.1b) is to replace it by an identity which contains a certain nonnegative Radon measure. Notwithstanding, thanks to a suitable mass control involving this measure and an accurate description of the boundary conditions based on the concept of normal traces for divergence-measure fields [5], our generalised supersolution coincides with a classical solution in the case of regular u and v .

The rest of the paper is organised in the following way. In *Section 2* we introduce and discuss the assumptions on the initial data, the proposed supersolution concept (cl. *Definition 2.2*), and two main results: *Theorem 2.6* deals with existence of such supersolutions, while *Theorem 2.7* establishes a connection to the classical solvability. In *Section 3* we prepare some ingredients which are necessary to our proof of *Theorem 2.6* in *Section 4*. *Theorem 2.7* is proved in the closing *Section 5*. Finally, *Appendix A* contains some facts on the divergence-measure fields which we use in this paper.

Acknowledgment. The author expresses her thanks to the reviewers for their helpful comments.

2 Generalised supersolutions to (1.1)

We assume throughout that the initial data satisfies the following assumptions:

$$0 < u_0, v_0 \in L^1(\Omega) \tag{2.1}$$

and

$$u_0^{-a} v_0^{-b} \in L^1(\Omega) \quad \text{for some } a, b > 0. \tag{2.2}$$

Remark 2.1 (Initial conditions).

1. Conditions (2.1)-(2.2) are to be compared to (1.7) in [15]. We impose less regularity for u_0 and v_0 , as well as allow, e.g., v_0 to touch zero at some points in $\bar{\Omega}$. Yet, since we deal with negative powers of u_0 , we cannot consider general $u_0 \geq 0$ which vanish on sets of non-zero Lebesgue measure.
2. In our existence result, *Theorem 2.6* below, we require (1.5) to hold in addition. Observe that b_+ is a strictly increasing function, and one readily sees that

$$b_+(a) \xrightarrow{a \rightarrow 0} 0.$$

Hence, given any small b , we only need to satisfy $a \in (0, (b_+)^{-1}(b))$, so that a can be chosen arbitrary small as well. On the whole, this makes it easier to satisfy (1.5).

Motivated by an idea from [15] we introduce the following concept of a generalised supersolution with a mass control:

Definition 2.2 (Generalised supersolution). *Let (u_0, v_0) satisfy conditions (2.1) and (2.2). We call a pair of measurable functions $(u, v) : \mathbb{R}_0^+ \times \bar{\Omega} \rightarrow \mathbb{R}^+ \times \mathbb{R}^+$ a generalised supersolution to system (1.1) if*

- (i) $u \in L^\infty(\mathbb{R}^+; L^1(\Omega))$, $v \in L_{loc}^1(\mathbb{R}_0^+; W^{1,1}(\Omega))$, $v^{-1} \in L_{loc}^\infty(\mathbb{R}^+ \times \bar{\Omega})$;
- (ii) $u^{-\frac{a}{2}}v^{-\frac{b}{2}} \in L_{loc}^2(\mathbb{R}_0^+; H^1(\Omega)) \cap L_{loc}^\infty(\mathbb{R}_0^+; L^2(\Omega))$, $u^{-\frac{a}{2}}v^{-\frac{b}{2}-1}\nabla v \in L_{loc}^2(\mathbb{R}_0^+; L^2(\Omega))$,
 $u^{-a+1}v^{-b-1} \in L_{loc}^1(\mathbb{R}_0^+; L^1(\Omega))$;
- (iii) $\int_0^\infty \psi (\nabla(u^{-a}v^{-b}) + \chi au^{-a}v^{-b-1}\nabla v) ds$, $\int_0^\infty \psi \nabla v ds \in \mathcal{DM}^p(\Omega)$ for all $\psi \in C_0^1(\mathbb{R}_0^+)$ for some $p \in (1, \frac{n}{n-1})$;
- (iv) for all $0 \leq \varphi \in C^1(\bar{\Omega})$ and $0 \leq \psi \in C_0^1(\mathbb{R}_0^+)$ it holds that

$$\begin{aligned} & - \int_0^\infty \partial_t \psi \int_\Omega u^{-a}v^{-b} \varphi dx dt - \psi(0) \int_\Omega u_0^{-a}v_0^{-b} \varphi dx \\ & \leq -4 \int_0^\infty \psi \int_\Omega \left(\frac{a+1}{a} \left| \nabla \left(u^{-\frac{a}{2}}v^{-\frac{b}{2}} \right) \right|^2 + \left(\frac{b}{a} + \chi \frac{a+1}{2} \right) \nabla \left(u^{-\frac{a}{2}}v^{-\frac{b}{2}} \right) \cdot u^{-\frac{a}{2}}v^{-\frac{b}{2}-1} \nabla v \right. \\ & \quad \left. + \frac{1}{4} \left(\frac{b^2}{a} + b + \chi b \right) \left| u^{-\frac{a}{2}}v^{-\frac{b}{2}-1} \nabla v \right|^2 \right) \varphi dx ds \\ & - \int_0^\infty \psi \int_\Omega (\nabla(u^{-a}v^{-b}) + \chi au^{-a}v^{-b-1}\nabla v) \cdot \nabla \varphi dx ds \\ & + \int_0^\infty \psi \int_\Omega (bu^{-a}v^{-b} - bu^{-a+1}v^{-b-1}) \varphi dx ds; \end{aligned} \tag{2.3}$$

- (v) there exists some non-negative Radon measure μ in $\mathbb{R}_0^+ \times \bar{\Omega}$, s.t. for all $0 \leq \varphi \in C^1(\bar{\Omega})$ and $0 \leq \psi \in C_0^1(\mathbb{R}_0^+)$ it holds that

$$- \int_0^\infty \partial_t \psi \int_\Omega v \varphi dx ds - \psi(0) \int_\Omega v_0 \varphi dx = \int_0^\infty \psi \int_\Omega -\nabla v \cdot \nabla \varphi + (-v + u) \varphi dx ds + \int_0^\infty \psi \int_{\bar{\Omega}} \varphi d\mu(s, x), \tag{2.4}$$

and

$$\int_0^\infty \psi \|u(t, \cdot)\|_{L^1(\Omega)} ds + \int_0^\infty \psi \int_{\bar{\Omega}} d\mu(s, x) \leq \|u_0\|_{L^1(\Omega)} \|\psi\|_{L^1(\mathbb{R}^+)}; \tag{2.5}$$

- (vi) for all $\psi \in C_0^1(\mathbb{R}_0^+)$ it holds that

$$\int_0^\infty \psi (\nabla(u^{-a}v^{-b}) + \chi au^{-a}v^{-b-1}\nabla v) ds \cdot \nu|_{\partial\Omega} = 0 \quad \text{in } W^{-\frac{1}{p}, p}(\partial\Omega), \tag{2.6}$$

$$\int_0^\infty \psi \nabla v ds \cdot \nu|_{\partial\Omega} = 0 \quad \text{in } W^{-\frac{1}{p}, p}(\partial\Omega). \tag{2.7}$$

Several remarks are in order.

Remark 2.3 (Boundary conditions). The variational reformulations (2.6)-(2.7) of the boundary conditions (1.1c) are consistent with the regularity assumptions in (iii), cf. [5, Theorem 2.1]. Some necessary facts on the spaces $\mathcal{DM}^p(\Omega)$ are recalled for the reader's convenience in *Appendix A*.

Remark 2.4 (Coupled quantities).

1. One of the well-known difficulties to be faced while dealing with a system like (1.1) in higher dimensions is the generally poor regularity of variable u . The reason lies in a comparative weakness of linear diffusion which often fails to compensate the aggregation due to taxis. At the same time, variable v is much better-behaved. Our previous studies of highly-degenerate haptotaxis systems [26, 27] suggest that it can be helpful to introduce a quantity which involves *both* variables and possesses an integrable gradient. Thereby, the choice of such coupled quantity depends to a large extent upon estimates one is able to derive for a given system. In particular, in the present case it turns out to be fruitful to study the term $u^{-\frac{a}{2}}v^{-\frac{b}{2}}$ and to include its gradient into the supersolution concept.
2. Since $u^{-\frac{a}{2}}v^{-\frac{b}{2}} \in L^2_{loc}(\mathbb{R}_0^+; H^1(\Omega))$, we have due to the weak chain rule and the Hölder inequality that $u^{-\frac{a}{2}}v^{-\frac{b}{2}} \in L^1_{loc}(\mathbb{R}_0^+; W^{1,1}(\Omega))$. On the whole, the regularity imposed by (i)-(iii) ensures that all integrals in the variational formulations (2.3)-(2.7) do make sense.

Remark 2.5 (Comparison with the solution concept from [15]). The main difference between our construction and the generalised solution concept in [15] is the presence of a nonnegative and, in general, nonzero measure μ on the right-hand side in the weak formulation (2.4). This means that the pair (u, v) is actually a weak supersolution of (1.1b) but may, however, fail to be its subsolution. In particular, even if both u and v are smooth functions, the variational properties (2.3)-(2.4) do not on their own imply that (u, v) is a supersolution to (2.3). Fortunately, as it turns out, this property can be saved by taking into account the boundary conditions in form of (2.6)-(2.7), see the proof of *Theorem 2.7* below.

A control from above upon the total mass of the u -component of a generalised supersolution to system (1.1) was used in [15], as well as, for some similar chemotaxis problems, in [23, 24]. There it took the basic form

$$\|u(t, \cdot)\|_{L^1(\Omega)} \leq \|u_0\|_{L^1(\Omega)} \quad \text{for all } t \geq 0. \quad (2.8)$$

In our case (2.8) is replaced by a more general condition (2.5) which involves the aforementioned measure μ .

Our result on existence now reads:

Theorem 2.6 (Existence of generalised supersolutions). *Let χ be any positive number. Let the initial conditions u_0 and v_0 satisfy (2.1)-(2.2) for some constants a and b which fulfil (1.5). Then there exists a generalised supersolution (u, v) in terms of Definition 2.2.*

The proof of this theorem is based on a suitable regularisation and a series of priori estimates in *Section 3* leading into a limit procedure in *Section 4*.

Our interest in the introduced concept of generalised supersolutions is supported by the following result:

Theorem 2.7 (Classical solutions). *Let a pair (u, v) be a supersolution in terms of Definition 2.2. Assume in addition that*

$$u, v \in C^{1,2}(\mathbb{R}_0^+ \times \bar{\Omega})$$

and

$$\frac{u}{v} \in L^\infty_{loc}(\mathbb{R}_0^+ \times \bar{\Omega}). \quad (2.9)$$

Then (u, v) solves (1.1) in the classical sense.

The proof of *Theorem 2.7* is given in *Section 5*.

Remark 2.8 (Multiple time scales). Should u and v evolve on different time scales, one could account for this by introducing a scaling parameter $0 < \tau \neq 1$ into equation (1.1a):

$$\tau \partial_t u = \nabla \cdot \left(\nabla u - \chi \frac{u}{v} \nabla v \right).$$

Our results and, moreover, also their proofs, with obvious minor alterations, continue to hold in this case as well. The only substantial change regards the restrictions on a and b : assumption (1.5) has to be replaced by

$$a, b > 0 \quad \text{and} \quad ((1 - \tau)^2 a - 4\tau) b^2 + 2((1 - \tau)\chi a - 2\tau)b(a + 1) + \chi^2 a(a + 1)^2 < 0. \quad (2.10)$$

Obviously, (2.10) can be met for any $\chi > 0$ and $0 < \tau \neq 1$ by fixing some

$$0 < a < a_+(\tau) := \frac{4\tau}{(1 - \tau)^2},$$

and then choosing b sufficiently large. In particular, no smallness assumption on τ needs to be imposed, as was the done, e.g., in [7]. Altogether, this is a further confirmation of the robustness of the concept of the generalised solvability as proposed in *Definition 2.2* if compared to the classical one.

Remark 2.9 (Notation). We make the following useful convention: For any index i , a quantity C_i denotes a positive constant or, alternatively, a positive function of its arguments. Moreover, dependence upon such parameters as: the space dimension n , domain Ω , constants a, b, χ , as well as the structure of the initial data u_0, v_0 , is mostly **not** indicated in an explicit way.

3 Smooth regularisations for (1.1)

Let

$$2 \leq k \in \mathbb{N}.$$

Following [15], we consider a family of regularisations of system (1.1):

$$\begin{cases} \partial_t u_k = \nabla \cdot \left(\nabla u_k - \chi \frac{u_k}{v_k} \nabla v_k \right) & \text{in } (0, T) \times \Omega, & (3.1a) \\ \partial_t v_k = \Delta v_k - v_k + \frac{u_k}{1 + \frac{1}{k} u_k} & \text{in } (0, T) \times \Omega, & (3.1b) \\ \partial_\nu u_k = \partial_\nu v_k = 0 & \text{in } (0, T) \times \partial\Omega, & (3.1c) \\ u_k(0, \cdot) = u_{k0}, \quad v_k(0, \cdot) = v_{k0} & \text{in } \Omega. & (3.1d) \end{cases}$$

Thereby, we choose the regularised initial data u_{k0} and v_{k0} so as to satisfy

$$u_{k0}, v_{k0} \in W^{1,\infty}(\Omega), \quad \min_{\bar{\Omega}} u_{k0}, \min_{\bar{\Omega}} v_{k0} > 0, \quad (3.2)$$

as well as to be suitable approximations to the original starting values, u_0 and v_0 , see next sequel. Classical theory for upper-triangular systems (see, e.g., [1]) implies that (3.1) possesses a unique global classical solution (u_k, v_k) . Moreover, due to the maximum principle, both solution components are strictly positive in $\mathbb{R}_0^+ \times \bar{\Omega}$. These solutions are studied in *Subsections 3.2-3.4*.

3.1 Approximation of initial data

Apart from being smooth, we assume that u_{k0} and v_{k0} fulfil the following conditions: for all $k \in \mathbb{N}$ it holds that

$$u_{k0} \xrightarrow[k \rightarrow \infty]{} u_0 \quad \text{in } L^1(\Omega) \text{ and a.e. in } \Omega, \quad (3.3)$$

$$v_{k0} \xrightarrow[k \rightarrow \infty]{} v_0 \quad \text{in } L^1(\Omega) \text{ and a.e. in } \Omega, \quad (3.4)$$

$$u_{k0}^{-a} v_{k0}^{-b} \xrightarrow[k \rightarrow \infty]{} u_0^{-a} v_0^{-b} \quad \text{in } L^1(\Omega) \text{ and a.e. in } \Omega. \quad (3.5)$$

Let us check that these conditions can be met. First, we observe that since $u_0, v_0 \in L^1(\Omega)$, there exist some sequences u_{k0} and v_{k0} which satisfy (3.2) and (3.3)-(3.4), as well as

$$u_{k0} \geq \begin{cases} \max \left\{ k^{-\frac{b}{a}}, u_0 \right\} & \text{for } u_0 < k, \\ k & \text{for } u_0 \geq k, \end{cases} \quad (3.6)$$

$$v_{k0} \geq \begin{cases} \max \{k^{-\frac{a}{b}}, v_0\} & \text{for } u_0 < k, \\ k & \text{for } v_0 \geq k. \end{cases} \quad (3.7)$$

Using (3.6)-(3.7), we compute that

$$u_{k0}^{-a} v_{k0}^{-b} \leq \max \{u_0^{-a} v_0^{-b}, 1\} \quad \text{a.e. in } \Omega. \quad (3.8)$$

Combining (2.2), (3.3)-(3.4), and (3.8) with the dominated convergence theorem we obtain (3.5).

3.2 Basic properties of (3.1)

Integrating equations (3.1a) and (3.1b) over Ω and using the boundary conditions and partial integration we obtain the following information about the total masses: for all $t \geq 0$

$$\|u_k(t, \cdot)\|_{L^1(\Omega)} = \|u_{k0}\|_{L^1(\Omega)}, \quad (3.9)$$

$$\|v_k(t, \cdot)\|_{L^1(\Omega)} \leq (1 - e^{-t}) \|u_{k0}\|_{L^1(\Omega)} + e^{-t} \|v_{k0}\|_{L^1(\Omega)}. \quad (3.10)$$

Due to (3.9)-(3.10) and a classical result based on duality (see, e.g., the proof of Lemma 5 in [4, Appendix A]) we have for all

$$(r, s) \in \left[1, \frac{n+2}{n}\right) \times \left[1, \frac{n+2}{n+1}\right)$$

that

$$\{(v_k, \nabla v_k)\}_{k \in (0,1]} \text{ is precompact in } L^r((0, T) \times \Omega) \times L^s((0, T) \times \Omega). \quad (3.11)$$

Further, using the maximum principle and the strict positivity of the Neumann heat kernel, we conclude from (3.1b) and (3.4) that v_k can be controlled from below in the following way:

$$\begin{aligned} \inf_{(\tau, T) \times \Omega} v_k &\geq \inf_{(\tau, T) \times \Omega} e^{-t} e^{t\Delta} v_{k0} \\ &\geq C_1(\tau, T) \|v_{k0}\|_{L^1(\Omega)} \\ &\geq C_2(\tau, T) > 0 \quad \text{for all } 0 < \tau < T < \infty. \end{aligned} \quad (3.12)$$

3.3 A variational formulation for (3.1)

Let $F \in C^2(\mathbb{R}^+ \times \mathbb{R}^+)$. Multiplying (3.1a) and (3.1b) by $\partial_u F(u_k, v_k)$ and $\partial_v F(u_k, v_k)$, respectively, adding the results together, and using the chain rule where necessary, we compute that

$$\begin{aligned} &\partial_t F(u_k, v_k) \\ &= - \left(\nabla u_k - \chi \frac{u_k}{v_k} \nabla v_k \right) \left(\partial_{uu} F(u_k, v_k) \nabla u_k + \partial_{uv} F(u_k, v_k) \nabla v_k \right) + \nabla \cdot \left(\partial_u F(u_k, v_k) \left(\nabla u_k - \chi \frac{u_k}{v_k} \nabla v_k \right) \right) \\ &\quad - \nabla v_k \cdot \left(\partial_{uv} F(u_k, v_k) \nabla u_k + \partial_{vv} F(u_k, v_k) \nabla v_k \right) + \nabla \cdot \left(\partial_v F(u_k, v_k) \nabla v_k \right) \\ &\quad + \partial_v F(u_k, v_k) \left(-v_k + \frac{u_k}{1 + \frac{1}{k} u_k} \right) \\ &= - \left(\partial_{uu} F(u_k, v_k) |\nabla u_k|^2 + 2 \left(\partial_{uv} F(u_k, v_k) - \frac{\chi}{2} \frac{u_k}{v_k} \partial_{uu} F(u_k, v_k) \right) \nabla u_k \cdot \nabla v_k \right. \\ &\quad \left. + \left(\partial_{vv} F(u_k, v_k) - \chi \frac{u_k}{v_k} \partial_{uv} F(u_k, v_k) \right) |\nabla v_k|^2 \right) \\ &\quad + \nabla \cdot \left(\partial_u F(u_k, v_k) \nabla u_k + \left(\partial_v F(u_k, v_k) - \chi \frac{u_k}{v_k} \partial_u F(u_k, v_k) \right) \nabla v_k \right) + \partial_v F(u_k, v_k) \left(-v_k + \frac{u_k}{1 + \frac{1}{k} u_k} \right). \end{aligned} \quad (3.13)$$

Now we choose F as in (1.4). Using the chain rule where necessary, one easily verifies that

$$\nabla u_k = -\frac{2}{a} u_k^{\frac{a}{2}+1} v_k^{\frac{b}{2}} \left(\nabla \left(u_k^{-\frac{a}{2}} v_k^{-\frac{b}{2}} \right) + \frac{b}{2} \left(u_k^{-\frac{a}{2}} v_k^{-\frac{b}{2}-1} \nabla v_k \right) \right), \quad (3.14)$$

$$\nabla v_k = u_k^{\frac{a}{2}} v_k^{\frac{b}{2}+1} \left(u_k^{-\frac{a}{2}} v_k^{-\frac{b}{2}-1} \nabla v_k \right). \quad (3.15)$$

Plugging (3.14)-(3.15) into (3.13) we arrive, after some computation, at the following identity:

$$\begin{aligned}
\partial_t (u_k^{-a} v_k^{-b}) &= -4 \left(\frac{a+1}{a} \left| \nabla \left(u_k^{-\frac{a}{2}} v_k^{-\frac{b}{2}} \right) \right|^2 + \left(\frac{b}{a} + \chi \frac{a+1}{2} \right) \nabla \left(u_k^{-\frac{a}{2}} v_k^{-\frac{b}{2}} \right) \cdot u_k^{-\frac{a}{2}} v_k^{-\frac{b}{2}-1} \nabla v_k \right. \\
&\quad \left. + \frac{1}{4} \left(\frac{b^2}{a} + b + \chi b \right) \left| u_k^{-\frac{a}{2}} v_k^{-\frac{b}{2}-1} \nabla v_k \right|^2 \right) \\
&\quad + \nabla \cdot \left(\nabla (u_k^{-a} v_k^{-b}) + \chi a u_k^{-a} v_k^{-b-1} \nabla v_k \right) + b u_k^{-a} v_k^{-b} - b \frac{u_k^{-a+1}}{1 + \frac{1}{k} u_k} v_k^{-b-1}. \tag{3.16}
\end{aligned}$$

Multiplying (3.16) by an arbitrary function $\psi \in C_0^1(\mathbb{R}_0^+)$ and integrating by parts w.r.t. t yields for all $x \in \Omega$ that

$$\begin{aligned}
& - \int_0^\infty u_k^{-a} v_k^{-b} \partial_t \psi \, dt - u_{k0}^{-a} v_{k0}^{-b} \psi(0) \\
&= -4 \int_0^\infty \left(\frac{a+1}{a} \left| \nabla \left(u_k^{-\frac{a}{2}} v_k^{-\frac{b}{2}} \right) \right|^2 + \left(\frac{b}{a} + \chi \frac{a+1}{2} \right) \nabla \left(u_k^{-\frac{a}{2}} v_k^{-\frac{b}{2}} \right) \cdot u_k^{-\frac{a}{2}} v_k^{-\frac{b}{2}-1} \nabla v_k \right. \\
&\quad \left. + \frac{1}{4} \left(\frac{b^2}{a} + b + \chi b \right) \left| u_k^{-\frac{a}{2}} v_k^{-\frac{b}{2}-1} \nabla v_k \right|^2 \right) \psi \, dt \\
&\quad + \nabla \cdot \int_0^\infty \left(\nabla (u_k^{-a} v_k^{-b}) + \chi a u_k^{-a} v_k^{-b-1} \nabla v_k \right) \psi \, dt + \int_0^\infty \left(b u_k^{-a} v_k^{-b} - b \frac{u_k^{-a+1}}{1 + \frac{1}{k} u_k} v_k^{-b-1} \right) \psi. \tag{3.17}
\end{aligned}$$

On the other hand, multiplying (3.16) by an arbitrary function $\varphi \in C^1(\bar{\Omega})$ and integrating by parts w.r.t. x and using the boundary conditions where necessary yields that

$$\begin{aligned}
\int_\Omega \partial_t (u_k^{-a} v_k^{-b}) \varphi &= -4 \int_\Omega \left(\frac{a+1}{a} \left| \nabla \left(u_k^{-\frac{a}{2}} v_k^{-\frac{b}{2}} \right) \right|^2 + \left(\frac{b}{a} + \chi \frac{a+1}{2} \right) \nabla \left(u_k^{-\frac{a}{2}} v_k^{-\frac{b}{2}} \right) \cdot u_k^{-\frac{a}{2}} v_k^{-\frac{b}{2}-1} \nabla v_k \right. \\
&\quad \left. + \frac{1}{4} \left(\frac{b^2}{a} + b + \chi b \right) \left| u_k^{-\frac{a}{2}} v_k^{-\frac{b}{2}-1} \nabla v_k \right|^2 \right) \varphi \, dx \\
&\quad - \int_\Omega \left(\nabla (u_k^{-a} v_k^{-b}) + \chi a u_k^{-a} v_k^{-b-1} \nabla v_k \right) \cdot \nabla \varphi \, dx \\
&\quad + \int_\Omega \left(b u_k^{-a} v_k^{-b} - b \frac{u_k^{-a+1}}{1 + \frac{1}{k} u_k} v_k^{-b-1} \right) \varphi \, dx. \tag{3.18}
\end{aligned}$$

Finally, if we multiply (3.16) by the product $\psi\varphi$ and integrate by parts w.r.t. t and x , then we arrive at the following variational reformulation of (3.16):

$$\begin{aligned}
& - \int_0^\infty \partial_t \psi \int_\Omega u_k^{-a} v_k^{-b} \varphi \, dx \, dt - \psi(0) \int_\Omega u_{k0}^{-a} v_{k0}^{-b} \varphi \, dx \\
&= -4 \int_0^\infty \psi \int_\Omega \left(\frac{a+1}{a} \left| \nabla \left(u_k^{-\frac{a}{2}} v_k^{-\frac{b}{2}} \right) \right|^2 + \left(\frac{b}{a} + \chi \frac{a+1}{2} \right) \nabla \left(u_k^{-\frac{a}{2}} v_k^{-\frac{b}{2}} \right) \cdot u_k^{-\frac{a}{2}} v_k^{-\frac{b}{2}-1} \nabla v_k \right. \\
&\quad \left. + \frac{1}{4} \left(\frac{b^2}{a} + b + \chi b \right) \left| u_k^{-\frac{a}{2}} v_k^{-\frac{b}{2}-1} \nabla v_k \right|^2 \right) \varphi \, dx \, ds \\
&\quad - \int_0^\infty \psi \int_\Omega \left(\nabla (u_k^{-a} v_k^{-b}) + \chi a u_k^{-a} v_k^{-b-1} \nabla v_k \right) \cdot \nabla \varphi \, dx \, ds \\
&\quad + \int_0^\infty \psi \int_\Omega \left(b u_k^{-a} v_k^{-b} - b \frac{u_k^{-a+1}}{1 + \frac{1}{k} u_k} v_k^{-b-1} \right) \varphi \, dx \, ds. \tag{3.19}
\end{aligned}$$

For equation (3.1b) a standard procedure yields the following reformulations: for all $0 \leq \varphi \in C^1(\bar{\Omega})$ and $0 \leq \psi \in C_0^1(\mathbb{R}_0^+)$ it holds that

$$- \int_0^\infty v_k \partial_t \psi \, ds - \psi(0) v_{k0} = \nabla \cdot \int_0^\infty \psi \nabla v_k \, dt + \int_0^\infty \left(-v_k + \frac{u_k}{1 + \frac{1}{k} u_k} \right) \psi \, dt \tag{3.20}$$

and

$$- \int_0^\infty \partial_t \psi \int_\Omega v_k \varphi \, dx \, ds - \psi(0) \int_\Omega v_{k0} \varphi \, dx = \int_0^\infty \psi \int_\Omega -\nabla v_k \cdot \nabla \varphi + \left(-v_k + \frac{u_k}{1 + \frac{1}{k} u_k} \right) \varphi \, dx \, ds. \tag{3.21}$$

3.4 Further uniform estimates for (3.1)

Choosing $\varphi \equiv 1$ in (3.18) yields that

$$\begin{aligned} \frac{d}{dt} \int_{\Omega} u_k^{-a} v_k^{-b} dx &= \int_{\Omega} -4 \left(\frac{a+1}{a} \left| \nabla \left(u_k^{-\frac{a}{2}} v_k^{-\frac{b}{2}} \right) \right|^2 + \left(\frac{b}{a} + \chi \frac{a+1}{2} \right) \nabla \left(u_k^{-\frac{a}{2}} v_k^{-\frac{b}{2}} \right) \cdot u_k^{-\frac{a}{2}} v_k^{-\frac{b}{2}-1} \nabla v_k \right. \\ &\quad \left. + \frac{1}{4} \left(\frac{b^2}{a} + b + \chi b \right) \left| u_k^{-\frac{a}{2}} v_k^{-\frac{b}{2}-1} \nabla v_k \right|^2 \right) + b u_k^{-a} v_k^{-b} - b \frac{u_k^{-a+1}}{1 + \frac{1}{k} u_k} v_k^{-b-1} dx. \end{aligned} \quad (3.22)$$

Due to the key assumption (1.5) it holds that

$$\begin{aligned} 0 &> \left(\frac{b}{a} + \chi \frac{a+1}{2} \right)^2 - \frac{a+1}{a} \left(\frac{b^2}{a} + b + \chi b \right) = \chi^2 \frac{(a+1)^2}{4} - \frac{(b+a+1)b}{a} \\ \Leftrightarrow \chi^2 &< 4 \frac{(b+a+1)b}{a(a+1)^2}. \end{aligned} \quad (3.23)$$

Thus, the quadratic form

$$Q(U, V) := 4 \left(\frac{a+1}{a} |U|^2 + \left(\frac{b}{a} + \chi \frac{a+1}{2} \right) U \cdot V + \frac{1}{4} \left(\frac{b^2}{a} + b + \chi b \right) |V|^2 \right) \quad (3.24)$$

is strictly convex and satisfies

$$Q(U, V) \geq C_3 (|U|^2 + |V|^2) \quad \text{for all } U, V \in \mathbb{R}^n. \quad (3.25)$$

Then, due to (3.25), we have with (3.22) that

$$\frac{d}{dt} \int_{\Omega} u_k^{-a} v_k^{-b} dx + \int_{\Omega} C_3 \left(\left| \nabla \left(u_k^{-\frac{a}{2}} v_k^{-\frac{b}{2}} \right) \right|^2 + \left| u_k^{-\frac{a}{2}} v_k^{-\frac{b}{2}-1} \nabla v_k \right|^2 \right) + b \frac{u_k^{-a+1}}{1 + \frac{1}{k} u_k} v_k^{-b-1} dx \leq b \int_{\Omega} u_k^{-a} v_k^{-b} dx. \quad (3.26)$$

Applying Gronwall's lemma to the differential inequality (3.26) we arrive at

$$\begin{aligned} &\int_{\Omega} u_k^{-a} v_k^{-b} dx + \int_0^t \int_{\Omega} C_3 \left(\left| \nabla \left(u_k^{-\frac{a}{2}} v_k^{-\frac{b}{2}} \right) \right|^2 + \left| u_k^{-\frac{a}{2}} v_k^{-\frac{b}{2}-1} \nabla v_k \right|^2 \right) + b \frac{u_k^{-a+1}}{1 + \frac{1}{k} u_k} v_k^{-b-1} dx ds \\ &\leq e^{bt} \int_{\Omega} u_{k0}^{-a} v_{k0}^{-b} dx \\ &\leq C_4(T). \end{aligned} \quad (3.27)$$

Integral inequality (3.27) yields the following set of estimates:

$$\left\| \nabla \left(u_k^{-\frac{a}{2}} v_k^{-\frac{b}{2}} \right) \right\|_{L^2((0,T) \times \Omega)} \leq C_5(T), \quad (3.28)$$

$$\left\| u_k^{-\frac{a}{2}} v_k^{-\frac{b}{2}-1} \nabla v_k \right\|_{L^2((0,T) \times \Omega)} \leq C_5(T), \quad (3.29)$$

$$\left\| u_k^{-\frac{a}{2}} v_k^{-\frac{b}{2}} \right\|_{L^\infty(0,T; L^2(\Omega))} \leq C_5(T), \quad (3.30)$$

$$\left\| \frac{u_k^{-a+1}}{1 + \frac{1}{k} u_k} v_k^{-b-1} \right\|_{L^1((0,T) \times \Omega)} \leq C_5(T). \quad (3.31)$$

Due to a Sobolev-type inequality (see, e.g., [13, Chapter II §3 (3.4)]), estimates (3.28) and (3.30) imply that

$$\left\| u_k^{-a} v_k^{-b} \right\|_{L^{1+\frac{2}{n}}((0,T) \times \Omega)} \leq C_6(T). \quad (3.32)$$

Thanks to estimates (3.28) and (3.32) and the Hölder inequality we obtain that

$$\left\| \nabla \left(u_k^{-a} v_k^{-b} \right) \right\|_{L^{\frac{n+2}{n+1}}((0,T) \times \Omega)} \leq C_7(T). \quad (3.33)$$

Similarly, estimates (3.29) and (3.32) and the Hölder inequality imply that

$$\|u_k^{-a} v_k^{-b-1} \nabla v_k\|_{L^{\frac{n+2}{n+1}}((0,T) \times \Omega)} \leq C_8(T). \quad (3.34)$$

Combining (3.33)-(3.34) we conclude that

$$\|\nabla (u_k^{-a} v_k^{-b}) + \chi a u_k^{-a} v_k^{-b-1} \nabla v_k\|_{L^{\frac{n+2}{n+1}}((0,T) \times \Omega)} \leq C_9(T). \quad (3.35)$$

Thanks to (3.28)-(3.31) and (3.35) we deduce from (3.18) that

$$\|\partial_t (u_k^{-a} v_k^{-b})\|_{L^1(0,T;(W^{1,n+2}(\Omega))^*)} \leq C_{10}. \quad (3.36)$$

Further, due to (3.5) and (3.28)-(3.31) we deduce from (3.17) that for all $\psi \in C_0^1(\mathbb{R}_0^+)$ it holds that

$$\left\| \nabla \cdot \int_0^\infty \psi (\nabla (u_k^{-a} v_k^{-b}) + \chi a u_k^{-a} v_k^{-b-1} \nabla v_k) dt \right\|_{L^1(\Omega)} \leq C_{11}(\psi). \quad (3.37)$$

Similarly, using (3.4) and (3.9)-(3.10) we deduce from (3.20) that

$$\left\| \nabla \cdot \int_0^\infty \psi \nabla v_k dt \right\|_{L^1(\Omega)} \leq C_{12}(\psi). \quad (3.38)$$

Remark 3.1 (Sign of b). Condition (3.23) would also be satisfied if

$$b < b_-(a) := -\frac{1+a}{2} \left(\sqrt{1 + \chi^2 a} + 1 \right).$$

However, in this case

$$b < 0,$$

which implies that the sign of the last term on the left-hand side of (3.26) is positive. Consequently, the immediate control upon this term is lost. Similar to the analysis [15] one would then be forced to impose restrictions upon χ and the space dimension n in order to be able to bind it by means of other terms.

4 Convergence to a generalised supersolution of (1.1): proof of Theorem 2.6

Throughout this sequel we assume that

$$0 \leq \varphi \in C^1(\overline{\Omega}), \quad 0 \leq \psi \in C_0^1(\mathbb{R}_0^+),$$

and are arbitrary.

Based on the properties established in Section 3 we conclude that a subsequence k_m and measurable functions $u, v, \eta : [0, \infty) \times \overline{\Omega} \rightarrow \mathbb{R}^+$ exist, such that: due to (3.11),

$$v_{k_m} \xrightarrow{m \rightarrow \infty} v \quad \text{in } L_{loc}^r(\mathbb{R}_0^+ \times \overline{\Omega}) \text{ and a.e. in } \mathbb{R}^+ \times \Omega, \quad (4.1)$$

$$\nabla v_{k_m} \xrightarrow{m \rightarrow \infty} \nabla v \quad \text{in } L_{loc}^s(\mathbb{R}_0^+ \times \overline{\Omega}) \text{ and a.e. in } \mathbb{R}^+ \times \Omega; \quad (4.2)$$

due to (3.12) and (4.1), for all $0 < \tau < T < \infty$

$$\text{ess inf}_{(\tau, T) \times \Omega} v \geq C_2(\tau, T) > 0, \quad (4.3)$$

so that $v^{-1} \in L_{loc}^\infty(\mathbb{R}^+ \times \overline{\Omega})$;

due to (3.33), (3.36), and the Lions-Aubin lemma [19, Corollary 4],

$$u_{k_m}^{-a} v_{k_m}^{-b} \xrightarrow{m \rightarrow \infty} \eta \quad \text{in } L_{loc}^1(\mathbb{R}_0^+ \times \overline{\Omega}) \text{ and a.e. in } \mathbb{R}^+ \times \Omega; \quad (4.4)$$

due to (4.1) and (4.4),

$$\begin{aligned} u_{k_m}^{-1} &= (u_{k_m}^{-a} v_{k_m}^{-b})^{\frac{1}{a}} v_{k_m}^{\frac{b}{a}} \\ &\xrightarrow{m \rightarrow \infty} \eta^{\frac{1}{a}} v^{\frac{b}{a}} \in [0, \infty) \quad \text{a.e. in } \mathbb{R}^+ \times \Omega; \end{aligned} \quad (4.5)$$

due to (4.5),

$$u_{k_m} \xrightarrow{m \rightarrow \infty} \eta^{-\frac{1}{a}} v^{-\frac{b}{a}} =: u \in (0, \infty] \quad \text{a.e. in } \mathbb{R}^+ \times \Omega; \quad (4.6)$$

due to (3.9), (4.6), and Fatou's lemma,

$$u_{k_m} \xrightarrow{m \rightarrow \infty} u \in (0, \infty) \quad \text{a.e. in } \mathbb{R}^+ \times \Omega, \quad (4.7)$$

and $u \in L^\infty(\mathbb{R}^+; L^1(\Omega))$;

due to (4.1), (4.4), (4.7),

$$u_{k_m}^{-a} v_{k_m}^{-b} \xrightarrow{m \rightarrow \infty} u^{-a} v^{-b} \quad \text{in } L_{loc}^1(\mathbb{R}_0^+ \times \bar{\Omega}) \text{ and a.e. in } \mathbb{R}^+ \times \Omega; \quad (4.8)$$

due to (3.29), (4.1), (4.2), (4.7), and the Lions lemma,

$$u_{k_m}^{-\frac{a}{2}} v_{k_m}^{-\frac{b}{2}-1} \nabla v_{k_m} \xrightarrow{m \rightarrow \infty} u^{-\frac{a}{2}} v^{-\frac{b}{2}-1} \nabla v \quad \text{in } L_{loc}^2(\mathbb{R}_0^+ \times \bar{\Omega}); \quad (4.9)$$

due to (3.28), (4.8), and the Banach-Alaoglu theorem,

$$\nabla \left(u_{k_m}^{-\frac{a}{2}} v_{k_m}^{-\frac{b}{2}} \right) \xrightarrow{m \rightarrow \infty} \nabla \left(u^{-\frac{a}{2}} v^{-\frac{b}{2}} \right) \quad \text{in } L_{loc}^2(\mathbb{R}_0^+ \times \bar{\Omega}); \quad (4.10)$$

due to (3.33), (4.8), and the Banach-Alaoglu theorem,

$$\nabla (u_{k_m}^{-a} v_{k_m}^{-b}) \xrightarrow{m \rightarrow \infty} \nabla (u^{-a} v^{-b}) \quad \text{in } L_{loc}^{\frac{n+2}{n+1}}(\mathbb{R}_0^+ \times \bar{\Omega}); \quad (4.11)$$

due to (3.34), (4.1), (4.2), (4.7), and the Lions lemma,

$$u_{k_m}^{-a} v_{k_m}^{-b-1} \nabla v_{k_m} \xrightarrow{m \rightarrow \infty} u^{-a} v^{-b-1} \nabla v \quad \text{in } L_{loc}^{\frac{n+2}{n+1}}(\mathbb{R}_0^+ \times \bar{\Omega}); \quad (4.12)$$

due to (4.11)-(4.12),

$$\nabla (u_{k_m}^{-a} v_{k_m}^{-b}) + u_{k_m}^{-a} v_{k_m}^{-b-1} \nabla v_{k_m} \xrightarrow{m \rightarrow \infty} \nabla (u^{-a} v^{-b}) + u^{-a} v^{-b-1} \nabla v \quad \text{in } L_{loc}^{\frac{n+2}{n+1}}(\mathbb{R}_0^+ \times \bar{\Omega}); \quad (4.13)$$

due to (4.1) and (4.7),

$$\frac{u_{k_m}^{-a+1}}{1 + \frac{1}{k_m} u_{k_m}} v_{k_m}^{-b-1} \xrightarrow{m \rightarrow \infty} u^{-a+1} v^{-b-1} \quad \text{a.e. in } \mathbb{R}^+ \times \Omega; \quad (4.14)$$

due to (3.31), (4.14), and Fatou's lemma,

$$\liminf_{m \rightarrow \infty} \int_0^\infty \psi \int_\Omega \frac{u_{k_m}^{-a+1}}{1 + \frac{1}{k_m} u_{k_m}} v_{k_m}^{-b-1} \varphi \, dx ds \geq \int_0^\infty \psi \int_\Omega u^{-a+1} v^{-b-1} \varphi \, dx ds, \quad (4.15)$$

and $u^{-a+1} v^{-b-1} \in L_{loc}^1(\mathbb{R}_0^+; L^1(\Omega))$;

due to (4.7),

$$\frac{u_{k_m}}{1 + \frac{1}{k_m} u_{k_m}} \xrightarrow{m \rightarrow \infty} u \quad \text{a.e. in } (0, T) \times \Omega; \quad (4.16)$$

due to (3.3), (3.9), and the Banach-Alaoglu theorem, there exists some $\mu \in \mathcal{M}(\mathbb{R}_0^+ \times \bar{\Omega})$ s.t.

$$\lim_{m \rightarrow \infty} \int_0^\infty \psi \int_\Omega \frac{u_{k_m}}{1 + \frac{1}{k_m} u_{k_m}} \varphi \, dx ds = \int_0^\infty \psi \int_\Omega u \varphi \, dx ds + \int_0^\infty \psi \int_{\bar{\Omega}} \varphi \, d\mu(t, x); \quad (4.17)$$

due to (4.16) and Fatou's lemma,

$$\lim_{m \rightarrow \infty} \int_0^\infty \psi \int_\Omega \frac{u_{k_m}}{1 + \frac{1}{k_m} u_{k_m}} \varphi \, dx ds \geq \int_0^\infty \psi \int_\Omega u \varphi \, dx ds; \quad (4.18)$$

due to (4.17) and (4.18),

$$\int_0^\infty \psi \int_\Omega \varphi \, d\mu(t, x) \geq 0,$$

so that μ is a non-negative measure;
due to (3.3) and (3.9),

$$\begin{aligned} \int_0^\infty \psi \int_\Omega \frac{u_{k_m}}{1 + \frac{1}{k_m} u_{k_m}} \, dx ds &\leq \int_0^\infty \psi \int_\Omega u_{k_m} \, dx ds \\ &= \int_0^\infty \psi \, ds \int_\Omega u_{k_m 0} \, dx \\ &\xrightarrow{m \rightarrow \infty} \int_0^\infty \psi \, ds \int_\Omega u_0 \, dx; \end{aligned} \quad (4.19)$$

due to (4.17) (set $\varphi \equiv 1$) and (4.19), u satisfies (2.5);

due to (4.9), (4.10), and the convexity of Q (was defined in (3.24)), for all $0 \leq \varphi \in C([0, T] \times \bar{\Omega})$

$$\begin{aligned} \liminf_{m \rightarrow \infty} \int_0^T \int_\Omega \varphi Q \left(\nabla \left(u_{k_m}^{-\frac{a}{2}} v_{k_m}^{-\frac{b}{2}} \right), u_{k_m}^{-\frac{a}{2}} v_{k_m}^{-\frac{b}{2}-1} \nabla v_{k_m} \right) \, dx ds \\ \geq \int_0^T \int_\Omega \varphi Q \left(\nabla \left(u^{-\frac{a}{2}} v^{-\frac{b}{2}} \right), u^{-\frac{a}{2}} v^{-\frac{b}{2}-1} \nabla v \right) \, dx ds; \end{aligned} \quad (4.20)$$

due to (3.37), (4.13), and the Banach-Alaoglu theorem,

$$\begin{aligned} \nabla \cdot \int_0^\infty \psi \left(\nabla \left(u_{k_m}^{-a} v_{k_m}^{-b} \right) + \chi a u_{k_m}^{-a} v_{k_m}^{-b-1} \nabla v_{k_m} \right) \, dt \\ \xrightarrow{m \rightarrow \infty} \nabla \cdot \int_0^\infty \psi \left(\nabla \left(u^{-a} v^{-b} \right) + \chi a u^{-a} v^{-b-1} \nabla v \right) \, dt \quad \text{in } \mathcal{M}(\bar{\Omega}), \end{aligned} \quad (4.21)$$

and

$$\int_0^\infty \psi \left(\nabla \left(u^{-a} v^{-b} \right) + \chi a u^{-a} v^{-b-1} \nabla v \right) \, dt \in \mathcal{DM}^{\frac{n+2}{n+1}}(\Omega);$$

due to (A.2), (3.1c), (4.13), and (4.21), (u, v) satisfies (2.6);

due to (3.38), (4.2), and the Banach-Alaoglu theorem,

$$\nabla \cdot \int_0^\infty \psi \nabla v_{k_m} \, dt \xrightarrow{m \rightarrow \infty} \nabla \cdot \int_0^\infty \psi \nabla v \, dt \quad \text{in } \mathcal{M}(\bar{\Omega}), \quad (4.22)$$

and

$$\int_0^\infty \psi \nabla v \, dt \in \mathcal{DM}^s(\Omega);$$

due to (A.2), (3.1c), (4.2), and (4.22), v satisfies (2.7).

Altogether, combining (3.5), (4.8), (4.15), (4.20), and (4.21), we deduce from (3.19) for $k = k_m$ by taking limit superior as $m \rightarrow \infty$ that (u, v) satisfies (2.3). Finally, passing to the limit in (3.21) for $k = k_m$ as $m \rightarrow \infty$, and using (4.1), (4.2), and (4.17), we find that (u, v) satisfies (2.4). *Theorem 2.6* is proved.

5 Classical solutions to (1.1): proof of *Theorem 2.7*

In this final section we prove *Theorem 2.7*. Thus, we assume now that u and v are smooth and satisfy (2.9) and verify that in this case (u, v) is, in fact, a classical solution to (1.1).

Since v is smooth, the weak boundary condition (2.7) implies that $\partial_\nu v(t, \cdot)$ vanishes on the boundary of $\partial\Omega$ for all $t > 0$. Further, since both u and v are smooth, the weak boundary condition (2.6) takes the form

$$\partial_\nu (u^{-a}v^{-b}) + \chi au^{-a}v^{-b-1}\partial_\nu v = 0 \quad \text{for all } (t, x) \in (0, T) \times \partial\Omega.$$

This means that

$$-au^{-a-1}v^{-b} \left(\partial_\nu u - \chi \frac{u}{v} \partial_\nu v \right) - bu^{-a}v^{-b-1}\partial_\nu v = 0 \quad \text{for all } (t, x) \in (0, T) \times \partial\Omega. \quad (5.1)$$

Dividing (5.1) by $-au^{-a-1}v^{-b}$ and plugging the boundary condition for v , we conclude that $\partial_\nu u(t, \cdot)$ vanishes on $\partial\Omega$ for all $t > 0$ as well.

Next, exploiting the smoothness of u and v , we integrate by parts in (2.3) w.r.t. t and x and then apply the Du Bois-Reymond lemma. This results in the differential inequality

$$\left(-au^{-a-1}v^{-b} \left(\partial_t u - \nabla \cdot \left(\nabla u - \chi \frac{u}{v} \nabla v \right) \right) \right) - bu^{-a}v^{-b-1} (\partial_t v - (\Delta v - v + u)) \leq 0 \quad \text{in } \mathbb{R}^+ \times \Omega. \quad (5.2)$$

Similarly, (2.4) implies that $\mu = \xi dxdt$ for some smooth density function $\xi \geq 0$ and

$$\partial_t v = \Delta v - v + u + \xi \quad \text{in } \mathbb{R}^+ \times \Omega. \quad (5.3)$$

Dividing (5.2) by $-au^{-a-1}v^{-b}$ and making use of (5.3) we deduce that

$$\partial_t u - \nabla \cdot \left(\nabla u - \chi \frac{u}{v} \nabla v \right) \geq -\frac{b}{a} \frac{u}{v} \xi \quad \text{in } \mathbb{R}^+ \times \Omega. \quad (5.4)$$

Integrating (5.4) by parts over Ω thereby using the boundary conditions and, subsequently, integrating over $(0, t)$ for any $t > 0$ we then have that

$$\|u(t, \cdot)\|_{L^1(\Omega)} \geq \|u_0\|_{L^1(\Omega)} - \frac{b}{a} \int_0^t \int_\Omega \frac{u}{v} \xi dx ds. \quad (5.5)$$

On the other hand, due to the Du Bois-Reymond lemma inequality (2.5) is equivalent to the following:

$$\|u(t, \cdot)\|_{L^1(\Omega)} + \|\xi(t, \cdot)\|_{L^1(\Omega)} \leq \|u_0\|_{L^1(\Omega)} \quad \text{for all } t \geq 0. \quad (5.6)$$

Thus, combining (5.5)-(5.6) with (2.9) we conclude that

$$\begin{aligned} \|\xi(t, \cdot)\|_{L^1(\Omega)} &\leq \frac{b}{a} \int_0^t \int_\Omega \frac{u}{v} \xi dx ds \\ &\leq C_{13}(T) \int_0^t \|\xi(s, \cdot)\|_{L^1(\Omega)} ds \quad \text{for all } 0 \leq t \leq T < \infty \end{aligned}$$

which yields that

$$\xi \equiv 0 \quad (5.7)$$

due to the Gronwall lemma. Plugging (5.7) into (5.3), (5.4), and (5.6) immediately yields that (1.1b) is satisfied in the classical sense, and it holds that

$$\partial_t u - \nabla \cdot \left(\nabla u - \chi \frac{u}{v} \nabla v \right) \geq 0 \quad \text{in } \mathbb{R}^+ \times \Omega \quad (5.8)$$

and

$$\|u(t, \cdot)\|_{L^1(\Omega)} = \|u_0\|_{L^1(\Omega)} \quad \text{for all } t \geq 0. \quad (5.9)$$

Since (5.8) is subject to the no-flux boundary conditions, (5.8) and (5.9) imply that equality holds in (5.8). Thus, equation (1.1a) is satisfied in the classical sense, and *Theorem 2.7* is proved.

Appendix A Divergence-measure fields and their normal traces

In this section we collect some facts concerning the divergence-measure fields.

Let $\mathcal{M}(\bar{\Omega})$ denote the space of Radon measures in $\bar{\Omega}$. We recall the definition of the Banach space of divergence-measure fields [5] and its norm:

$$\begin{aligned} \mathcal{DM}^p(\Omega) &:= \{F \in (L^p(\Omega))^n \mid \nabla \cdot F \in \mathcal{M}(\bar{\Omega})\}, \\ \|F\|_{\mathcal{DM}^p(\Omega)} &:= \|F\|_{(L^p(\Omega))^n} + \|\nabla \cdot F\|_{\mathcal{M}(\bar{\Omega})}. \end{aligned}$$

Thereby we assume that $p \in \left(1, \frac{n}{n-1}\right)$, which is sufficient for our needs. Following [5] we introduce a generalisation of the normal trace over the boundary of $\partial\Omega$ which automatically satisfies a Gauss-Green formula:

$$\langle F \cdot \nu|_{\partial\Omega}, \varphi \rangle := \int_{\Omega} F \cdot \nabla(\mathcal{E}\varphi) dx + \int_{\bar{\Omega}} (\mathcal{E}\varphi) d(\nabla \cdot F) \quad \text{for all } \varphi \in W^{\frac{1}{p}, \frac{p}{p-1}}(\partial\Omega). \quad (\text{A.1})$$

Here $\mathcal{E} : W^{\frac{1}{p}, \frac{p}{p-1}}(\partial\Omega) \rightarrow W^{1, \frac{p}{p-1}}(\Omega)$ is a usual extension operator, i.e., a continuous right inverse of the corresponding trace operator. It is known (see [5, Theorem 2.1]) that $F \cdot \nu|_{\partial\Omega} \in W^{-\frac{1}{p}, p}(\partial\Omega)$ and doesn't depend upon the particular choice of \mathcal{E} . Formula (A.1) ensures the following implication:

$$\left\{ \begin{array}{ll} F_m \xrightarrow{m \rightarrow \infty} F & \text{in } (L^p(\Omega))^n, \\ \nabla \cdot F_m \xrightarrow{m \rightarrow \infty} \nabla \cdot F & \text{in } \mathcal{M}(\bar{\Omega}) \end{array} \right. \Rightarrow F_m \cdot \nu|_{\partial\Omega} \xrightarrow{m \rightarrow \infty} F \cdot \nu|_{\partial\Omega} \quad \text{in } W^{-\frac{1}{p}, p}(\partial\Omega). \quad (\text{A.2})$$
