21 **Introduction**

22
23
24 Chronic cough is a common and troublesome clinical problem and currently there are no
25
26 effective treatments (1). While individual specialist cough clinics have been set up in some
27
28 European countries there is no formal mechanism to develop common management
29
30 approaches. Furthermore, the vast majority of clinical trials of novel anti-tussive treatment
31
32 have been conducted in a limited number of sites in the United Kingdom and United States
33
34 with little in the way of cough clinical trial infrastructure across Europe (2-7). The NEW
35
36 Understanding in the tReatment Of COUGH (NEUROCOUGH) Clinical Research
37
38 Collaboration seeks to address this through creating a platform allowing clinicians together
39
40 with researchers in academia and industrial partners across Europe and beyond to exchange
41
42 ideas and facilitate collaborations geared towards improved care and treatment for patients
43
44 with cough. The core aims of NEUROCOUGH are to;
45
46
47
48

- 49
50 i) Create a Registry of Europe-wide Specialist Cough Clinics operating according to agreed
51
52 and standardised protocols.
53
54
55 ii) Establish a Europe-wide registry of 'clinical trial ready' chronic cough patients suitable for
56
57 multi-centre experimental medicine studies and later phase precision medicine clinical trials.
58
59
60

1
2
3 iii) Seek public engagement to provide input into NEUROCOUGH based on the priorities
4
5 and unmet needs of patients
6

7
8 iv) Encourage early career researchers and clinicians into the field of cough
9

10
11 In time, we envisage NEUROCOUGH will bring clinicians, scientists, patients and industry
12
13 together for larger scale cough projects in a way that to date has not been possible.
14

15
16 NEUROCOUGH will place Europe at the forefront of clinical improvements in chronic
17
18 cough and provide a strong platform for attracting major clinical trials of anti-tussives, thus
19
20 speeding up drug discovery with the ultimate aim of providing better treatments for patients
21
22 with chronic cough.
23
24
25
26
27
28

29 **What is the clinical rationale for NEUROCOUGH?**

30
31
32 Chronic cough, defined as one persisting for more than 8 weeks, is among the commonest
33
34 clinical problems encountered by doctors both in general and hospital practice (1). Chronic
35
36 cough is recognised globally as an important clinical problem and to address the extent of
37
38 this, a number of the NEUROCOUGH researchers undertook a review of over 10,000
39
40 patients to determine the demographic profile attending specialist cough clinics worldwide
41
42 (8). Particularly evident from this study were the characteristics of patients seeking specialist
43
44 help for cough. In many cases the cough had persisted for years and with no effective
45
46 treatments available, many such patients are left frustrated with their clinicians unsure how
47
48 best to manage this condition. To understand the scope of the problem more completely, the
49
50 NEUROCOUGH researchers also undertook a survey in collaboration with the European
51
52 Lung Foundation (ELF) involving almost 2,000 people throughout Europe living with
53
54 chronic cough. Key findings were that the cough impacted considerably on patients' daily-
55
56 life activities with many reporting deterioration in health-related quality of life and feeling
57
58
59
60

1
2
3 fed-up and depressed (9). Many of those surveyed reported a complete lack of awareness
4 among their primary care physicians of cough as a distinct clinical problem and reported
5 seeing numerous clinicians and undergoing many failed trials of therapy. While there is
6 some consensus on the use of systematic protocols for the diagnosis and treatment of chronic
7 cough, standardisation across centres is variable (10). Furthermore, chronic cough can exist
8 as a distinct clinical entity termed ‘refractory’, ‘unexplained’ or ‘idiopathic’ chronic cough,
9 when no associated cause is apparent, or treatment of any associated causes is ineffective.

10
11
12
13
14
15
16
17
18
19
20 Cough can also be a prominent and troublesome symptom for patients with common lung
21 conditions including asthma, chronic obstructive pulmonary disease, idiopathic pulmonary
22 fibrosis and bronchiectasis. Cough is also considered as one of the potential treatable traits of
23 airway disease and acknowledging this more widely may help clinicians adopt a more
24 individualised approach to treating their patients (11). For example in asthma, patients with
25 cough are often given oral corticosteroids, yet this may not deliver adequate control while
26 exposing patients to the unacceptable side-effects of high dose steroids. In COPD, cough is
27 reported in 70% of patients (12), and many consider it to be extremely severe (13)
28 contributing to impaired quality of life (14). Cough is also a central clinical feature of
29 bronchiectasis and during an exacerbation the cough can become much worse and contributes
30 to impaired health status (15). In Sarcoidosis, chronic cough is a common symptom and is
31 associated with a heightened cough reflex (16). In idiopathic pulmonary fibrosis (IPF), a
32 chronic dry cough is as troublesome as breathlessness and remains difficult-to-treat (17).
33
34
35
36
37
38
39
40
41
42
43
44
45

48
49
50
51
52
53
54
55
56
57
58
59
60
Chronic cough remains difficult to manage and many patients self-medicate with ‘over the
counter’ (OTC) cough therapies despite a lack of evidence supporting their efficacy (18, 19).
Current estimates suggest that almost 3 billion Euros are spent annually throughout Europe
on OTC therapies that have little antitussive effects (20).

How NEUROCOUGH can improve mechanistic understanding of cough?

There is a growing recognition that chronic cough is a heterogeneous condition in terms of its presentation and causes and the underlying mechanisms are poorly understood representing a significant knowledge gap (21). A number of the NEUROCOUGH researchers have been instrumental in developing the concept that the common pathophysiological mechanism of cough, regardless of the aetiology, is an inflammation-induced injurious effect of the nervous system (neuro-inflammation). This leads to a cough hypersensitivity syndrome whereby neural pathways (in the airway and the brain) become damaged by factors including viral infection, and physical and chemical irritants (22, 23). This neural damage (neuropathy), analogous to that driving some forms of chronic pain, is central to the clinical problem of cough. The challenge is in defining the complex and heterogeneous neuronal mechanisms responsible to help identify targets for suppressing problematic cough whilst maintaining the protective cough that is essential for normal lung health. Recent work has led to greater understanding of the fundamental mechanisms of cough pathophysiology (24-28) and recent international collaboration through a European Respiratory Society (ERS) initiative has led to the innovative concept of Cough Hypersensitivity Syndrome (CHS) (23). While evidence for this concept needs to be strengthened, the emerging potential in this field is underpinned by recent and remarkable progress in novel target discovery in neurobiology (2) highlighting the timely nature of the NEUROCOUGH initiative.

How can NEUROCOUGH help to deliver better treatments for cough?

1
2
3 A key unmet need is the lack of effective antitussives and to date assessment of novel targets
4
5 in early ‘proof of concept’ clinical studies has come with mixed success. Although efficacy
6
7 has been observed with gabapentin (29) and the blocker of the ATP receptor, P2X3 (2, 7) in
8
9 subsets of cough patients, compounds directed at a range of potentially promising targets
10
11 including TRPV1(3), TRPA1(4) and voltage-gated sodium channels (6) have failed. This has
12
13 raised two important issues; firstly can we improve the predictive value of existing pre-
14
15 clinical cough model systems. In this regard it is our ambition that partnership activities
16
17 initiated through NEUROCOUGH, will pave a way forward to enhance translation of basic
18
19 discoveries into clinical success. Secondly, how can we identify the genetic and biological
20
21 characteristics that define the subgroups of ‘responsive’ cough patients to novel anti-tussive
22
23 therapies. Establishing a pan-European registry of well-phenotyped patients as detailed in our
24
25 second core objective below will provide future capacity for multicentre studies to determine
26
27 pathophysiological mechanisms and enable translation into later phase precision medicine
28
29 clinical trials.
30
31
32
33
34
35
36
37
38

39 **Why do we need NEUROCOUGH now?**

40
41
42 Europe’s cough researchers and clinicians have no formal mechanism to develop common
43
44 investigative and management approaches or to facilitate collaboration either with each other
45
46 or with partners from industry. Individual centres of cough expertise have been set up in
47
48 many countries across Europe but to date there has been no means to standardise and
49
50 harmonise the activity in these specialist clinics. In simple terms we have no idea currently
51
52 how patients with chronic cough are evaluated and managed between countries within
53
54 Europe. In addition, while there have been efforts to provide consensus on the optimal
55
56 management strategies this has been largely at an individual national level e.g. Germany,
57
58
59
60

1
2
3 Spain, Britain, France (30-33). Recently an ERS Taskforce on Cough has been established
4
5 with the first meeting of members held at the 2017 ERS Scientific Assembly in Milan and the
6
7 resulting publication soon to be published. A number of Taskforce members are National
8
9 Leads for NEUROCOUGH and will champion the Taskforce recommendations within their
10
11 respective countries. Finally, and perhaps most importantly, the vast majority of single and
12
13 multi-centre clinical trials of novel anti-tussives have to date, been conducted in the United
14
15 Kingdom and United States (2-7). As the number of potential novel compounds for cough is
16
17 growing and the need to conduct large Phase III studies of the most promising compounds is
18
19 pressing there is an opportunity for Europe to play a leading role as the ideal environment for
20
21 such studies by creating a unified approach to patient management and phenotyping. To
22
23 deliver on this objective NEUROCOUGH CRC will support the establishment of new
24
25 specialist cough clinics so creating much needed clinical trial infrastructure throughout
26
27 Europe.
28
29
30
31
32
33

34 In summary, recent advances in mechanistic understanding of cough coupled with interest in
35
36 its neurobiology and the development of novel therapeutic options has provided the perfect
37
38 environment in which to establish a CRC for cough. We strongly believe the
39
40 NEUROCOUGH network will advance cough research and clinical management throughout
41
42 Europe and generate a framework for future clinical trials.
43
44
45
46
47
48

49 **NEUROCOUGH objectives**

50
51 NEUROCOUGH seeks to achieve the following core objectives:

52
53
54 i) Quality Improvement in Clinical Care: To address the under provision of clinical expertise
55
56 in cough so evident in our patient survey we will undertake a real world questionnaire based
57
58 survey to accurately record how clinicians across the 1st wave of NEUROCOUGH partner
59
60

1
2
3 sites manage patients with chronic cough. The nature and extent of discordance between sites
4
5 will be reviewed and consensus on core assessment protocols will be reported and serve as a
6
7 template for those seeking to set up new specialist clinics in the future.
8
9

10 ***Anticipated output:*** The creation of a Registry of Europe-wide Specialist Cough Clinics
11
12 operating according to agreed and standardised protocols, which will be incorporated into
13
14 future guidelines.
15
16

17
18 ii) Establish a Chronic Cough Patient Registry: We aim to establish the first Europe-wide
19
20 chronic cough patient registry comprising pre-specified clinical, physiological and biological
21
22 data. An electronic data collection form for all these variables is being developed in
23
24 conjunction with the Health Informatics Centre (HIC) based at the University of Dundee.
25
26 NEUROCOUGH will generate a registry of carefully characterised chronic cough patients
27
28 (including those with refractory and unexplained cough) at existing 1st wave sites (Figure 1)
29
30 and then through an ‘open-door’ policy encourage 2nd wave cough centres across Europe to
31
32 join NEUROCOUGH and enter data.
33
34
35

36
37 ***Anticipated output:*** This resource will provide for the first time a Europe-wide registry of
38
39 ‘clinical trial ready’ chronic cough patients suitable for multi-centre experimental medicine
40
41 studies and later phase precision medicine clinical trials.
42
43
44

45 iii) Public Engagement: With support from the European Lung Foundation, a Cough Patient
46
47 Advisory Group (PAG) is currently being established to provide input into
48
49 NEUROCOUGH’s design and implementation based on the priorities and unmet needs of
50
51 patients. The PAG will support the dissemination of the NEUROCOUGH outputs by
52
53 providing resources for patients about diagnosis and treatment options, and through public
54
55 awareness activities. Specific attention will be given to improving awareness of cough
56
57 amongst primary care clinicians through links with ERS Assembly 1. The PAG will provide
58
59
60

1
2
3 perspective on study design, recruitment plans and assist with developing patient information
4 sheets and consent forms and improve ways to recruit participants to clinical trials.
5

6
7 ***Anticipated output:*** Disseminate and communicate the importance of diagnosing and treating
8 chronic cough.
9

10
11
12
13 iv) Enhance training and research capacity: NEUROCOUGH will provide the ideal platform
14 in collaboration with the ERS Research Agency and Assembly 5 to run themed Postgraduate
15 workshops led by expert clinical and scientific partners to encourage clinicians and
16 researchers in the early part of their career to form a specialist interest in cough. We
17 anticipate that in time, NEUROCOUGH would seek support for Research and Training
18 Fellowships to undertake innovative projects based on access to the NEUROCOUGH clinical
19 registry and any future associated biobanks. The output from the planned activities will be
20 available to all through a comprehensive communication strategy.
21
22

23
24
25
26
27
28
29
30
31
32 ***Anticipated output:*** Encourage early career researchers and clinicians into the field of cough
33

34 35 36 37 38 **How will NEUROCOUGH achieve its objectives?** 39

40
41 NEUROCOUGH has assembled a multidisciplinary team of leading cough specialist
42 clinicians together with clinical and basic science researchers from both academia and
43 industry to work with patients and the public in an integrated fashion.
44
45

46
47
48 NEUROCOUGH CRC is composed of a Steering Committee comprising the Co-chairs, 3
49 members of the Committee of National Leads (rotating on an annual basis), a member of the
50 Patient Advisory Group (PAG) and the Early Career Member responsible for the oversight of
51 the CRC as well as for the reporting to ERS. The Steering Committee will work closely with
52 the appointed representatives from each of Industry Partners. A NEUROCOUGH Registry
53 Scientific Committee responsible for the running of the registry will be developed. The
54
55
56
57
58
59
60

1
2
3 Registry Scientific Committee will have direct responsibility for the conduct of the registry
4 including ensuring compliance with the protocol. The Registry Scientific Committee will
5
6 work with the Steering Committee to provide direction on the strategic development of the
7
8 Registry and the monitoring core activities (Figure 2).
9
10
11
12
13
14
15

16 **A look forward with NEUROCOUGH**

17
18 It is anticipated that NEUROCOUGH, in collaboration with the ERS Research Agency, will
19 seek external funding support to develop a programme of work designed to address the
20
21 research priorities in cough and the unmet needs in the development of novel anti-tussives. A
22
23 number of these are listed in Table 1. Furthermore, there is a need to raise awareness of
24
25 cough as important and difficult to manage clinical problem in lung diseases including
26
27 COPD, asthma, IPF and bronchiectasis. NEUROCOUGH CRC envisages fruitful
28
29 collaborations with others within the ERS CRC family including but not limited to EMBARC
30
31 (34), SHARP (35) and CADSET (36).
32
33
34
35
36
37
38
39
40

41 **Conclusion**

42
43 NEUROCOUGH CRC brings together for the first time clinicians, scientists, patients and
44
45 industry to work in partnership with a vision to advance clinical management of chronic
46
47 cough throughout Europe, enhance research capability and generate a framework for clinical
48
49 trials. The purpose of this editorial is to inform and invite all who are interested in the field of
50
51 cough to join us in achieving these goals.
52
